MDS Frequency Report

2001-2007

MDS Frequency Statistics

The *MDS Frequency Report* summarizes the percentage of responses in each possible category for a number of clinical elements in the Minimum Data Set (MDS) database. The report uses the total number of MDS assessments completed (all assessments listed in Section A8) for each year covered to calculate the percentages. In 2007, 325,395 MDS assessments were selected for quarterly case mix calculations. Those assessments selected are a snapshot of the residents in nursing facilities at the end of the quarter and reflect those records used to determine the rate. The data provide demographic and clinical profiles, and trends of the nursing facility population in Ohio.

The MDS elements displayed are used in the calculation of either Resource Utilization Groups (RUGS - used in determining payment resource utilization groups), Resident Assessment Protocols (RAPs - used to further identify and evaluate the resident's strengths, problems, and needs), or Quality Measures/Indicators (QMs/QIs - used to point out potential problem areas in care). The frequencies are based on the most recent MDS assessments for all nursing facility residents in the state. Assessments are completed on admission and quarterly thereafter, annually, and when a significant change in a resident's clinical status occurs. Residents whose next quarterly or next comprehensive assessment is overdue are excluded from these tables.

Questions and responses were summarized and tabulated from the assessments submitted for each quarter and then compiled for each calendar year. The percentages shown are based on the number of responses for each item divided by the total number of responses for that item. Some items are not required for all assessments (e.g. demographic information on the face sheet is only submitted with initial admission assessments). These items have a single asterisk (*) next to them. Therefore, percentages are calculated using the total number of valid responses for each item, rather than the total number of residents with assessments.

Some questions on the MDS are mutually exclusive, and therefore, require a yes or no response. For these questions, it is expected that the percentage of yes or no responses will total 100 percent when added together. Other MDS questions may result in more than one valid response. For instance, Section K5 asks for information about the nutritional approaches that were used in the last seven days. The instructions state to check all responses that apply. For these types of questions, it is not expected that the percentages will add up to a meaningful value. These questions are identified in this report by the statement "more than one item may be checked per resident" appearing in the bottom left hand corner of the page.

Items with historical response rates of nearly 100 percent changed starting in 2002. Beginning with the June 2002 reporting quarter, many items not used in the calculation of RUGs were no longer required on Medicare PPS assessments. As a result, some items with historical response rates of nearly 100 percent have lower response rates beginning with CY2002. Items that impact RUGIII grouping are denoted with a double asterisk (**). A few new items were added to the NF Frequency Report in 2003 in sections AA, P, and T, including the reason for assessment and minutes of therapy both delivered and expected. Section W was added to the MDS in 2005, which includes the national provider ID, and influenza and pneumococcal vaccine information. Finally, beginning July 1, 2005, providers were given the option of completing a shorter version of the MDS (Medicare PPS Assessment Form (MPAF)) for quarterly review assessments, which resulted in a drop in the response rates of some sections and items that are not included in the MPAF. Items impacted by the MPAF are denoted with a footnote.
